

IN THE SPECIFICATION

Please replace the paragraph beginning at page 3, paragraph [0012], with the following rewritten paragraph:

[0012] Since the liquid dispenser of this invention for the container holding a liquid therein uses the liquid-lifting means which is comprised of the helical screw and the cylindrical tube as described above, it is ~~enabled-able~~ to draw the liquid held in the container through the delivery nozzle by rotating the helical screw through the helical screw-driving means. It is, therefore, capable of lifting not only a highly viscous liquid, such as shampoo or rinse, but also a fluid of extremely high viscosity, such as grease. Even in the case of the container of a comparatively large size that holds the liquid for delivery in a large quantity, the difficulty encountered by children and old people in manipulating the conventional air pump type liquid dispenser can be effectively prevented because the load spent in rotating the helical screw cannot increase extremely.

Please replace the paragraph beginning at page 5, paragraph [0025], with the following rewritten paragraph:

[0025] Fig. 11 is a cross ~~section-sectional~~ taken ~~through~~ in Fig. 10 along line XI-XI.
